**SR4E2-B2** 

7/8-14 UNF • Q\_\_\_60 l/min (16 GPM) • p\_\_\_350 bar (5100 PSI)

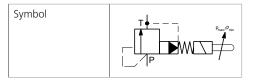

## **Technical Features**

- > Solenoid operated remote switching between minimum and maximum set pressure in the circuit
- > Combines the functionality of a pressure release valve and a pressure relief valve
- > Three-stage pressure, with a maximum settable pressure of 350 bar
- > Excellent stability throughout the flow volume range to 60/l min
- > Low hysteresis and accurate pressure control while switching
- > Easily interchangeable solenoid coil and plug positioning
- > In the standard version, the valve is zinc-coated for 240 h corrosion protection acc. to ISO 9227

#### **Functional Description**

The valve enables solenoid operated switching between two set system pressure values. Minimum and maximum values are set manually using two setting bolts located on the solenoid control system. When the solenoid is switched on the valve is set to maximum pressure. The maximum pressure is set by the pressure level of the valve and can be adjusted in the range of 7 - 120 / 210 / 350 bar. Minimum circuit pressure can be set from 7 bar to the set maximum pressure. Depending on the setting of minimum and maximum pressure values in the circuit the valve may combine functions of a pressure release and relief valve (eg 350 / 7 bar) or switch between two working pressure values (eg 250 / 100 bar).

CAUTION: A pressure change in T channel will cause a change of the set value of 1:1.

#### Relief pressure related to flow rate

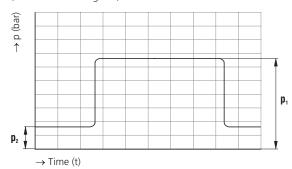

|   |   | Pressure range        |                       |
|---|---|-----------------------|-----------------------|
|   | 4 | 35                    |                       |
| ĺ | 3 | 21                    | Typical performance   |
| ĺ | 2 | 12                    |                       |
|   | 1 | Min. pressure setting | Solenoid de-energized |

# Example showing the adjustable pressures $p_1$ and $p_2$ ( $p_1 \ge p_2$ )

 $\mathbf{p}_{_{1}}$  (p\_max, relief pressure) is set as the higher working pressure (solenoid energized)

 $\rm p_2$  (p\_min, vented pressure) is set as a lower working pressure (solenoid de–energized)

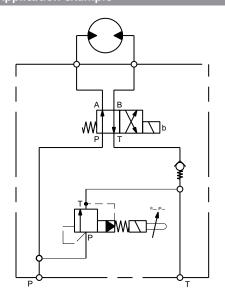

Page 1 www.argo-hytos.com

SMT-B2\*

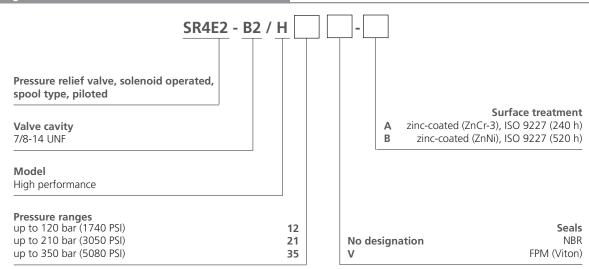

# **Application example**

The valve is used to unload a pump to tank with a very low pressure drop. This results in less heating of the oil and therefore lower energy costs for the user.

 $p_1$  (p\_max) must be set before  $p_2$  (p\_min). To set  $p_1$ , the solenoid is energized and the pressure adjusted with a flat wrench (size 10). The solenoid is then de-energized and the lower pressure adjusted with an allen key (hex. 3).

# **Ordering Code**

## Factory setting:

If the valve does not have a specific setting in accordance with the customer's order, standard valves are set to a minimum value of approx 7 bar after function tests.
